1. Executive Summary

- Net sales are concentrated: Electronics is the main category and drives more than half of total sales.
- Stock gap signals show $59,498,062 estimated lost sales. This is the largest operational risk.
- The A/B test is not ready for rollout: p-value is 0.241 and two stores had both variants.

2. Store Performance

- Best comparable store: TIENDA_036 with 27.4% growth.
- Weakest comparable store: TIENDA_025 with -8.0% growth.
- 10 stores are below the p25 of GMV per square meter inside their format.

3. Opportunities

- Fix low productivity stores first. Target the bottom 10 stores with a weekly action plan.
- 120 vendor-category combinations have GMROI below 1. They cost more than the gross margin they create.
- Loyalty M1 retention in the large early cohorts is 66.3%. The biggest drop happens after the first purchase.

4. Risks

- Data quality risk: 1,745 transactions do not match item totals. Use transaction total for store sales.
- Experiment risk: Treatment stores are smaller before the test. The groups are not fully balanced.
- Stock risk: top categories with gaps can erase millions in sales if supply is not corrected.

5. Recommendations

- Do not roll out the new display to all stores yet. Run a second balanced test by format and size.
- Create a daily stock alert for the top 20 Electronics SKUs. Owner: Supply Chain. Start in 30 days.
- Launch a 90-day productivity sprint for stores below p25 net sales per square meter. Owner: Regional Operations.
